University of British Columbia, Vancouver GEOS 300 - Microscale Weather and Climate Knox

Answers to Study Questions - Lecture 18

1. (a) \overline{T} is the temporal average of T:

$$\overline{T} = \frac{1}{6} \sum_{t=0}^{5} T(t)$$

$$= \frac{1}{6} (12.6 + 11.2 + 11.9 + 13.1 + 12.0 + 11.8)$$

$$= 12.1^{\circ}C$$

(b) T' is the deviation of a single measured value from the temporal average of the time series (\overline{T}) . For the time step at 40 min we can write:

$$T(40\text{min}) = \overline{T'} + \overline{T}(40\text{min})$$

 $T'(40\text{min}) = T(40\text{min}) - \overline{T}$
 $= 13.1^{\circ}\text{C} - 12.1^{\circ}\text{C}$
 $= 1 \text{ K}$

(c) T'^2 is the squared deviation for a a single measured value from the temporal average of the time series. For the time step at 20 min we can write: (\overline{T}) :

$$T'^{2}(20\text{min}) = (T(20\text{min}) - \overline{T})^{2}$$

= $(11.2^{\circ}\text{C} - 12.1^{\circ}\text{C})^{2}$
= $(-0.9^{\circ}\text{C})^{2}$
= 0.81 K^{2}

(d) $\overline{T'}$ is the average deviation in the time series. By definition, this term must be always zero, i.e $\overline{T'} = 0$ (or more general $\overline{a'} = 0$, where a

is any parameter or term). Let's check this:

$$\overline{T'} = \frac{1}{6} \sum_{t=0}^{5} (T(t) - \overline{T})$$

$$= \frac{1}{6} ((12.6 - 12.1) + (11.2 - 12.1) + (11.9 - 12.1) + (13.1 - 12.1) + (12.0 - 12.1) + (11.8 - 12.1))$$

$$= \frac{1}{6} (0.5 - 0.9 - 0.2 + 1.0 - 0.1 - 0.3)$$

$$= 0 \text{ K}$$

(e) $\overline{T'^2}$ is the the variance of the time series of T. It is defined as the average of the squared deviations of all time steps. This term is <u>not</u> necessarily zero¹

$$\overline{T'^2} = \frac{1}{6} \sum_{t=0}^{5} (T(t) - \overline{T})^2$$

$$= \frac{1}{6} \left((12.6 - 12.1)^2 + (11.2 - 12.1)^2 + (11.9 - 12.1)^2 + (13.1 - 12.1)^2 + (12.0 - 12.1)^2 + (11.8 - 12.1)^2 \right)$$

$$= \frac{1}{6} (0.25 + 0.81 + 0.04 + 1 + 0.01 + 0.09)$$

$$= 0.37 \,\text{K}^2$$

(f) $\overline{T'}^2$ is the temporal average of the deviations squared. Note the fine (but essential) difference of the overbar that does not include the square, and because $\overline{T'} = 0$ (see (d)) also its square is zero:

$$\overline{T'}^2 = \overline{T'} \times \overline{T'}$$

$$\overline{T'^2} = \frac{1}{N-1} \sum_{t=0}^{N-1} (T(t) - \overline{T})^2 = \frac{1}{5} \sum_{t=0}^{5} (T(t) - \overline{T})^2$$

However, in atmospheric turbulence studies, we prefer the biased variance (divided by N, as shown in the question above and the lecture slides where we divide by N). The biased variance is a good estimation of the dispersion of a sample of observations, but not necessarily the best measure of the whole population of possible observations.

¹Note for those who have taken statistics: You might be used to the *unbiased variance*, where you divide by N-1, not N:

$$= 0 K \times 0 K$$
$$= 0 K^{2}$$

2. (a) The average of a constant is equal the constant itself

$$\overline{5} = \frac{1}{1} \sum_{i=0}^{0} 5 = 5$$

(b) The average of a constant times a value is equal the constant times the averaged value:

$$\overline{8v} = 8 \times \overline{v}$$

(c) Similarly we can regard temporal averages as constants (they are not changing over time):

$$\overline{\overline{T}\overline{p}} = \overline{T}\overline{p}$$

(d) The average of an averaged value is equal the averaged value

$$\overline{\overline{u}} = \overline{u}$$

(e) Similar to 1(d):

$$\overline{q'} = 0$$

(f) Again, the first term is zero - so is it's product:

$$\overline{T'} \times \overline{w} = 0 \times \overline{w} = 0$$

(g)

$$\overline{3q'} = 3 \times \overline{q'} = 3 \times 0 = 0$$

(h)

$$\overline{w' \times \overline{u}} = \overline{w'} \times \overline{u} = 0 \times \overline{u} = 0$$

(i) Combining the results from (c) and (e):

$$\begin{array}{lcl} \overline{\overline{T}p} & = & \overline{T} \times \overline{(\overline{p} + p')} \\ & = & \overline{T}\overline{p} + \overline{T} \times \underbrace{\overline{p'}}_{=0} \\ & = & \overline{T}\overline{p} \end{array}$$

(j) In a first step apply Reynold's decomposition to both, w and T. One of the resulting terms is a covariance $(\overline{w'T'})$ which is not zero (see lecture):

$$\overline{wT} = \overline{(\overline{w} + w') \times (\overline{T} + T')}$$

$$= \overline{w}\overline{T} + \overline{\underline{w}T'} + \underline{\overline{w'}}\overline{T} + \overline{w'T'}$$

$$= \overline{w}\overline{T} + \underline{\overline{w'}T'}$$
Covariance

- 3. Calculate the following parameters if $\overline{u}=4\,\mathrm{m\,s^{-1}}, \ \overline{v}=0\,\mathrm{m\,s^{-1}}, \ \overline{w}=0\,\mathrm{m\,s^{-1}}, \ \overline{w}=0\,\mathrm{m\,s^{-1}}, \ \sigma_{v}=0.2\,\mathrm{m\,s^{-1}}, \ \mathrm{and} \ \sigma_{w}=0.1\,\mathrm{m\,s^{-1}}.$
 - (a) I_u is the turbulence intensity of the longitudinal wind component u. I_u has no unit.

$$I_u = \sigma_u/\overline{u}$$

= 0.4 m s⁻¹/4 m s⁻¹
= 0.1

(b) I_w is the turbulence intensity of the vertical wind component w. I_w has no unit.

$$I_w = \sigma_w/\overline{u}$$

= 0.1 m s⁻¹/4 m s⁻¹
= 0.025

(c) $\overline{w'^2}$ is the variance of the vertical wind component w. The variance is the square of the standard deviation σ_w :

$$\overline{w'^2} = \sigma_w^2$$

= $(0.1 \,\mathrm{m \, s^{-1}})^2$
= $0.01 \,\mathrm{m^2 \, s^{-2}}$

(d)

$$\overline{u'^2} + \overline{v'^2} + \overline{w'^2} = \sigma_u^2 + \sigma_v^2 + \sigma_w^2$$

$$= (0.4 \text{ m s}^{-1})^2 + (0.2 \text{ m s}^{-1})^2 + (0.1 \text{ m s}^{-1})^2$$

$$= 0.16 \text{ m}^2 \text{ s}^{-2} + 0.04 \text{ m}^2 \text{ s}^{-2} + 0.01 \text{ m}^2 \text{ s}^{-2}$$

$$= 0.21 \text{ m}^2 \text{ s}^{-2}$$

(e) MKE/m is the mean kinetic energy per unit mass (lecture 18, slide 15), i.e.

$$MKE/m = \frac{1}{2}(\overline{u}^2 + \overline{v}^2 + \overline{w}^2)$$
$$= \frac{1}{2}(4^2 + 0^2 + 0^2)$$
$$= \frac{1}{2}(16)$$
$$= 8 \text{ m}^2 \text{ s}^{-2}$$

(f) \overline{e} is the turbulent kinetic energy per unit mass (lecture 18, slide 15) i.e.

$$\overline{e} = \frac{1}{2} (\overline{u'^2} + \overline{v'^2} + \overline{w'^2})$$

$$= \frac{1}{2} (\sigma_u^2 + \sigma_v^2 + \sigma_w^2)$$

$$= \frac{1}{2} ((0.4 \text{ m s}^{-1})^2 + (0.2 \text{ m s}^{-1})^2 + (0.1 \text{ m s}^{-1})^2)$$

$$= \frac{1}{2} (0.16 \text{ m}^2 \text{ s}^{-2} + 0.04 \text{ m}^2 \text{ s}^{-2} + 0.01 \text{ m}^2 \text{ s}^{-2})$$

$$= 0.105 \text{ m}^2 \text{ s}^{-2}$$
